LIST OF TABLES

Table 1. Summary of station location, water quality and sediment data for the Chesapeake Bay stations, 2004 (Stations 1-60).

Table 2. Summary of overall abundance of major benthic macrofaunal taxonomic groups for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

Table 3. Summary of abundance of major benthic macrofaunal taxonomic groups by station for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

Table 4. Distribution and abundance of benthic macrofaunal taxa for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

Table 5. Percentage abundance of dominant benthic macrofaunal taxa (>10% of the total) for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

Table 6. Summary of the benthic macrofaunal data for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

LIST OF FIGURES

Figure 1. Water depth and salinity for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

Figure 2. Sediment composition for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

Figure 3. Sediment percent total organic carbon (TOC) for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

Figure 4. Distribution of major macroinvertebrate taxa for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

Figure 5. Taxa richness data for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

Figure 6. Taxa density data for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

Figure 7. Taxa diversity (H') data for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

Figure 8. Taxa evenness (J') data for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

INTRODUCTION

Chesapeake Bay was sampled during 2004. One aspect of this evaluation was benthic community characterization, which was accomplished via sample collection by National Oceanic and Atmospheric Administration (NOAA) personnel and laboratory and data analysis by Barry A. Vittor & Associates, Inc. (BVA). Location data for the Chesapeake Bay estuary stations are given in Table 1.

METHODS

Sample Collection And Handling

A Young-modified Van Veen grab (area = 0.04 m²) was used to collect 3 replicate bottom samples at each of the 60 stations during 2004. Results for Stations 18-21 and 27-60 are reported here. Macrofaunal samples were sieved through a 0.5-mm mesh screen and preserved with 10% formalin on ship. Macrofaunal samples were transported to the BVA laboratory in Mobile, Alabama.

Macrofaunal Sample Analysis

In the laboratory of BVA, benthic samples were inventoried, rinsed gently through a 0.5 mm mesh sieve to remove preservatives and sediment, stained with Rose Bengal, and stored in 70% isopropanol solution until processing. Sample material (sediment, detritus, organisms) was placed in white enamel trays for sorting under Wild M-5A dissecting microscopes. All macroinvertebrates were carefully removed with forceps and placed in labeled glass vials containing 70% isopropanol. Each vial represented a major taxonomic group (e.g. Polychaeta, Mollusca, Arthropoda). All sorted macroinvertebrates were identified to the lowest practical identification level (LPIL), which in most cases was to species level unless the specimen was a juvenile, damaged, or otherwise unidentifiable. The number of individuals of each taxon, excluding fragments, was recorded. A voucher collection was prepared, composed of representative individuals of each species not previously encountered in samples from the region.

DATA ANALYSIS

All data generated as a result of laboratory analysis of macroinfauna samples were first coded on data sheets. Enumeration data were entered for each species according to station and replicate. These data were reduced to a data summary report for each station, which included a taxonomic species list and benthic community parameters information. Archive data files of species identification and enumeration were prepared.

The Quality Assurance and Quality Control reports for the Chesapeake Bay samples are given in the Appendix.

Assemblage Structure

Several numerical indices were chosen for analysis and interpretation of the macroinfaunal data. Infaunal abundance is reported as the total number of individuals per station and the total number of individuals per square meter (= density). Taxa richness is reported as the number of taxa represented in a given station collection.

Taxa diversity, which is often related to the ecological stability and environmental "quality" of the benthos, was estimated by Shannon's Index (Pielou, 1966), according to the following formula:

$$H' = - \sum_{i=1}^S p_i (\ln p_i)$$

where, S = the number of taxa in the sample,

i = the i'th taxa in the sample, and

p_i = the number of individuals of the i'th taxa divided by the total number of individuals in the sample.

Taxa diversity was calculated using ln; however, diversity may also be calculated using \log_2 . Both methods of calculating diversity are common in the scientific literature. The taxa diversity calculated in this report using ln, can be converted to \log_2 diversity by

multiplying the \ln taxa diversity by 1.4427. Taxa diversity within a given community is dependent upon the number of taxa present (taxa richness) and the distribution of all individuals among those taxa (equitability or evenness). In order to quantify and compare the equitability in the fauna to the taxa diversity for a given area, Pielou's Index J' (Pielou, 1966) was calculated as $J' = H'/\ln S$, where $\ln S = H'_{\max}$, or the maximum possible diversity, when all taxa are represented by the same number of individuals; thus, $J' = H' / H'_{\max}$.

HABITAT CHARACTERISTICS

Water quality data are given for all 60 stations in Table 1 and water depth and salinity data for Stations 18-21 and 27-60 are plotted in Figure 1. Depths ranged from < 0.5 m at Station 60 to 6.7 m at Station 30. Salinities ranged from essentially freshwater at Stations 18-21 and 60 to estuarine at the remaining stations (Table 1, Figure 1).

Sediment texture and %TOC data for all 60 stations are given in Table 1 and data from Stations 18-21 and 27-60 are plotted in Figures 2 and 3. Sediment composition ranged from > 90% sand at Stations 40, 45-47, 53 and 60 to 96% silt+clay at Station 35. TOC ranged from < 0.1% at Stations 40, 45-57 and 53 to 12.3% at Station 31.

BENTHIC COMMUNITY CHARACTERIZATION

Microsoft TM Excel spreadsheets are being provided separately to NOAA which include: raw data on taxa abundance and density, a complete taxonomic listing with station abundance and occurrence, a major taxa table with overall taxa abundance, and an assemblage parameter table including data on number of taxa, density, taxa diversity and taxa evenness by station.

A total of 14863 organisms, representing 146 taxa, were identified from the 22 Chesapeake Bay stations (Table 2). Malacostracans were the most numerous organisms present representing 43.5% of the total assemblage, followed in abundance by polychaetes (28.5%) and oligochaetes (15.9%). Polychaetes represented 26.7% of the total number of taxa followed by malacostracans (24.7%), insects (13.7%), and bivalves (12.3%)(Table 2). The abundance of major taxa by station are given in Table 3 and Figure 4. Assemblage composition varied considerably between stations with polychaetes dominating at some stations (> 70% of the total at the Stations 27-29, 38, 41-44,48-52, 60), arthropods dominating (> 70% of the total) at Stations 21 and 54, and a mixed assemblage of polychaetes, mollusks and arthropods dominant at the remaining stations (Figure 4, Table 3).

The dominant taxon collected from the 22 Chesapeake Bay stations was the amphipod, *Apocorophium lacustre* which represented 22.3% of the total. The oligochaete family, Tubificidae (LPIL), the malacostracans, *Leptocheirus plumulosus* and *Gammarus tigrinus* and the polychaete, *Streblospio benedicti* were also abundant and represented 15.2%, 9.4%, 5.2 and 5.6% of the total individuals collected (Table 4). The Tubificidae were the most widely distributed taxon being found at 76% of the stations (Table 4). The distribution of dominant taxa representing > 10% of the total assemblage at each station is given in Table 5. Dominant taxa tended to follow salinity gradients with freshwater and euryhaline oligochaete taxa dominating at low salinity stations (< 3 ppt) and more estuarine fauna (polychaetes, amphipods) dominating at the higher salinity stations (Table 5).

Station taxa richness data are given in Table 6 and Figure 5. Taxa richness varied considerably between stations and ranged from 3.3 (SD = 0.6) at Station 51 to 28.3 (SD = 5.7) at Station 45 (Figure 5). Station density data are given in Table 6 and Figure 6. Station densities also exhibited considerable variation ranging from 266.7 organisms/m² (SD = 76.4) at Station 39 to 35416.7 organisms/m² (SD = 15589.5) at Station 21 (an *Apocorophium lacustre* mat).

Taxa diversity and evenness are given in Table 6 and Figures 7 and 8. Taxa diversity (H') ranged from 0.34 at Station 51 to 2.74 at Station 47 (Table 6, Figure 6). Taxa evenness (J') ranged from 0.21 at Station 51 to 0.89 at Station 39 (Table 6, Figure 7).

Table 6. Summary of the benthic macrofaunal data for the Chesapeake Bay stations 2004 (Stations 18-21, 27-60).

Table 6 continued:

Figure 1. Water depth and salinity for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

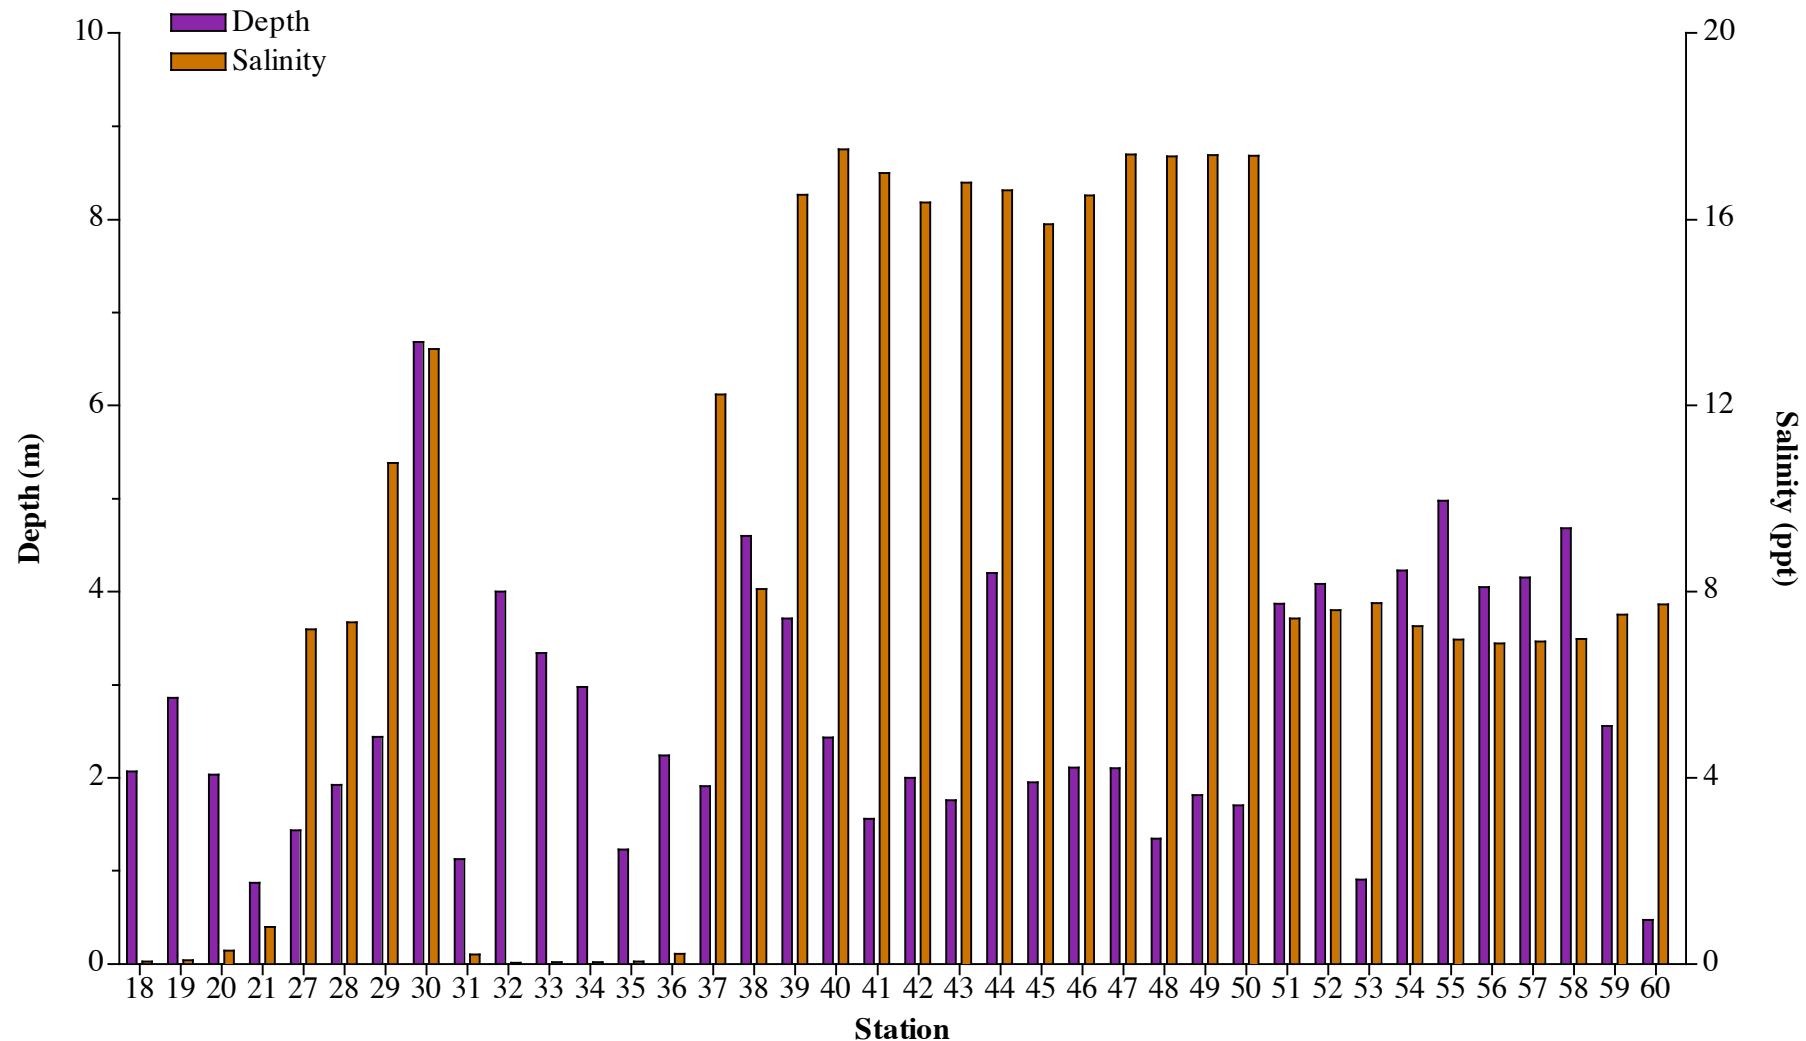

Figure 2. Sediment composition for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

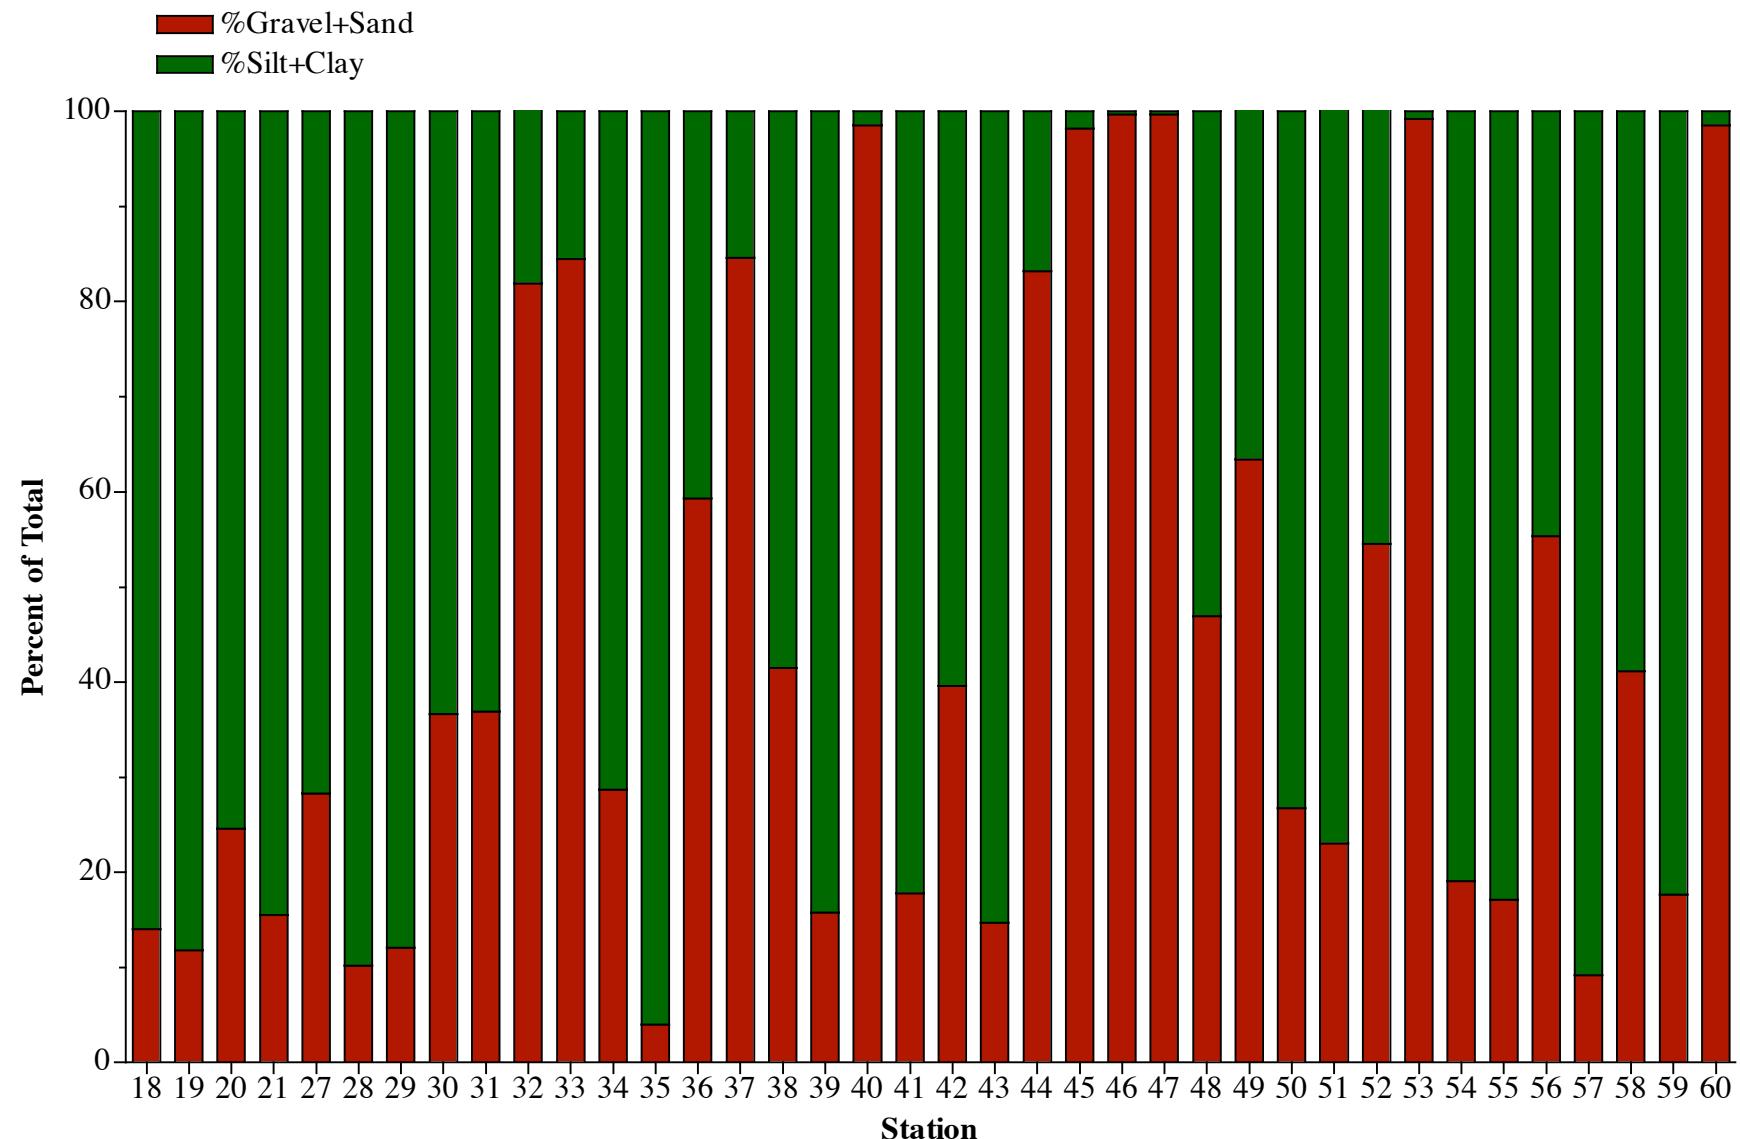

Figure 3. Sediment percent total organic carbon (TOC) for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

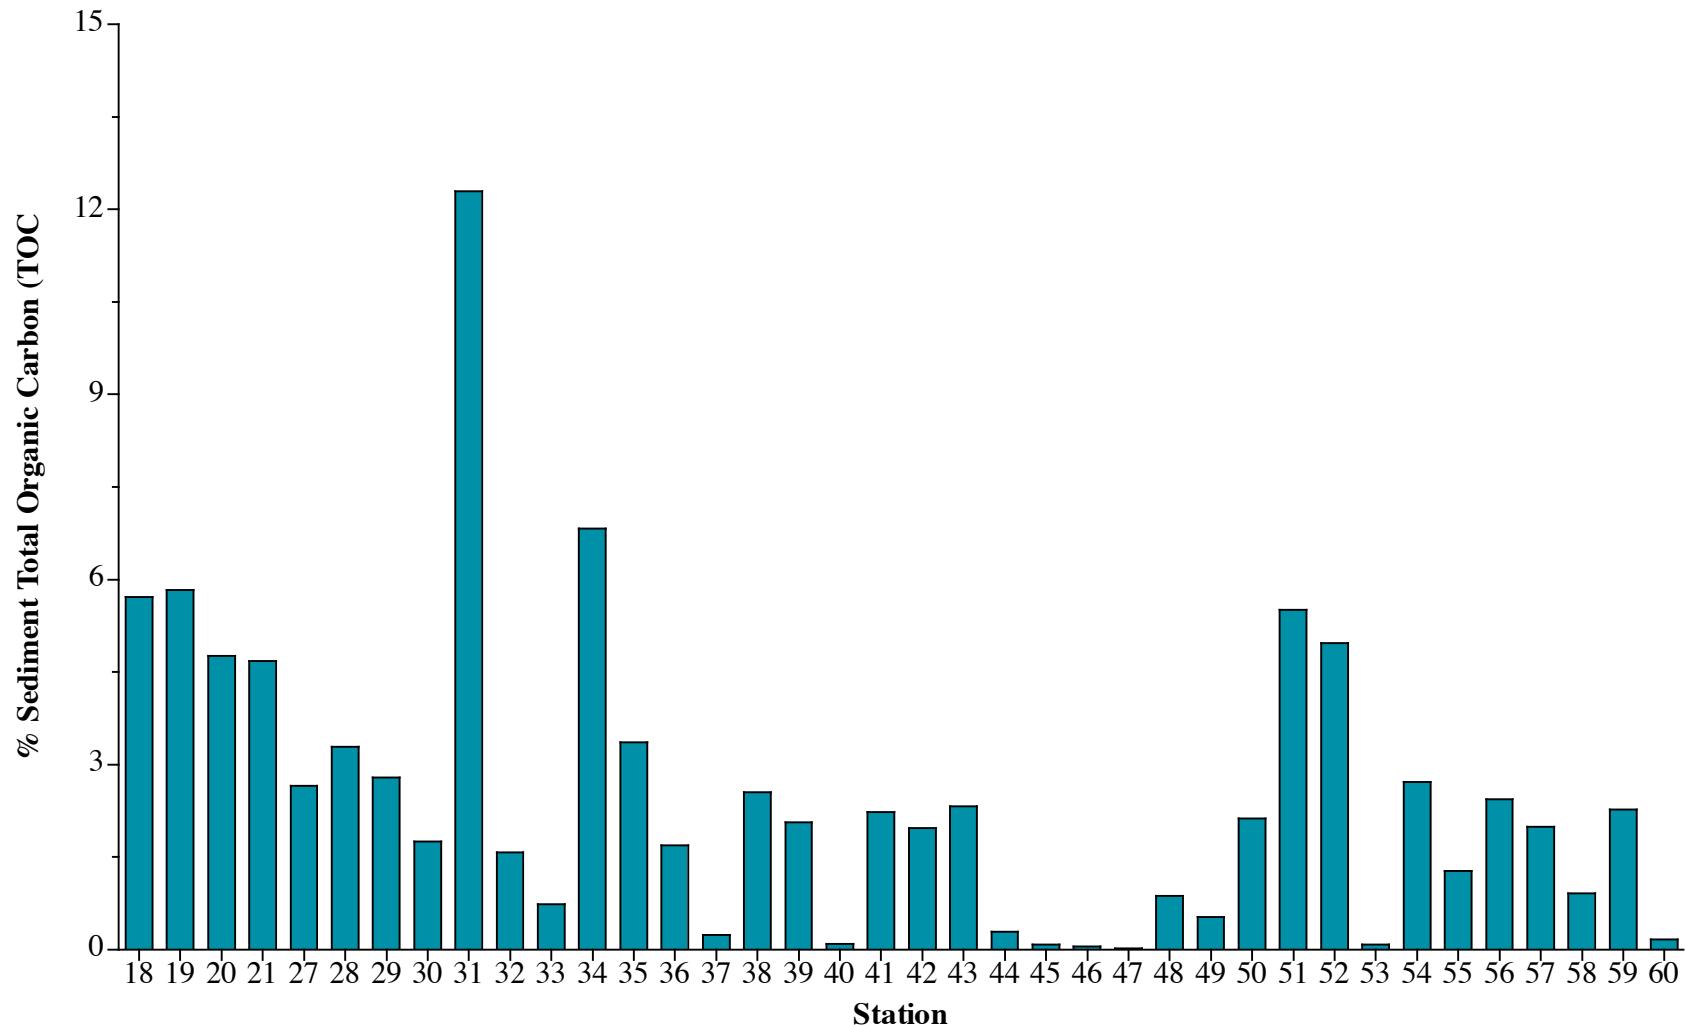

Figure 4. Distribution of major macroinvertebrate taxa for the Chesapeake Bay stations, 2004.

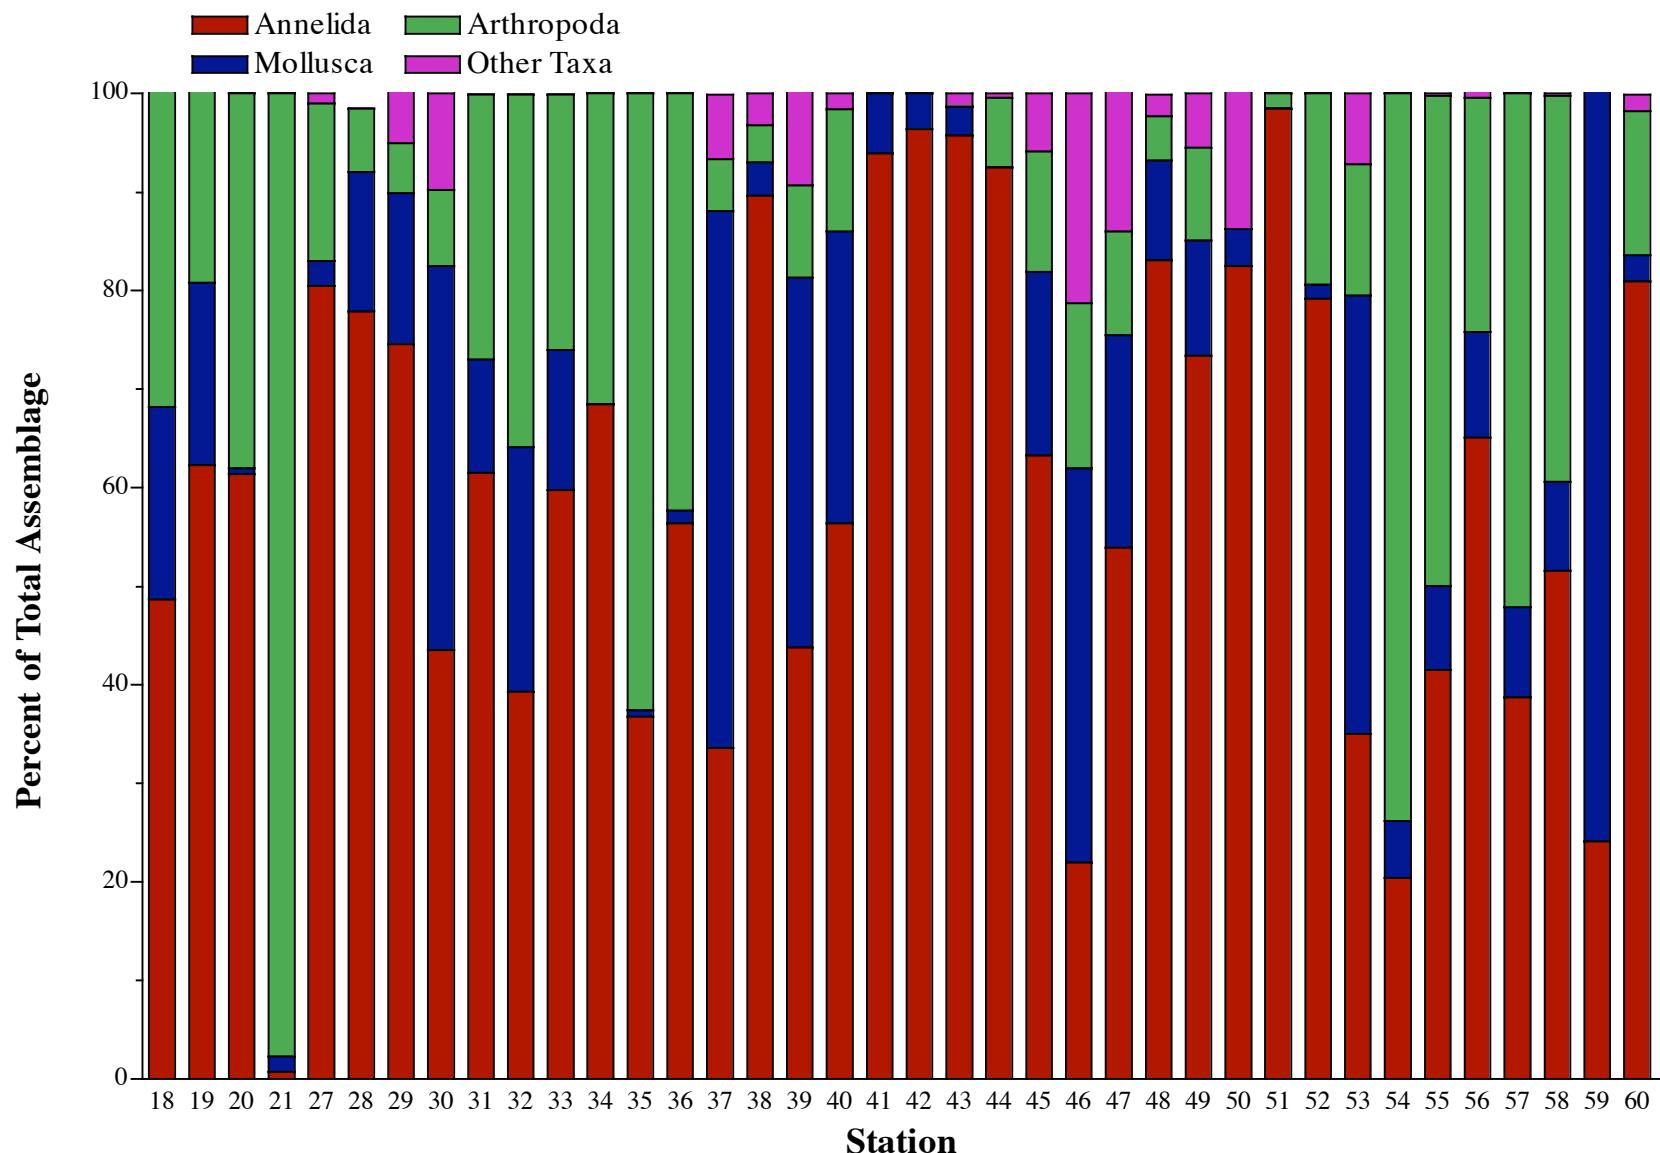

Figure 5. Taxa richness data for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

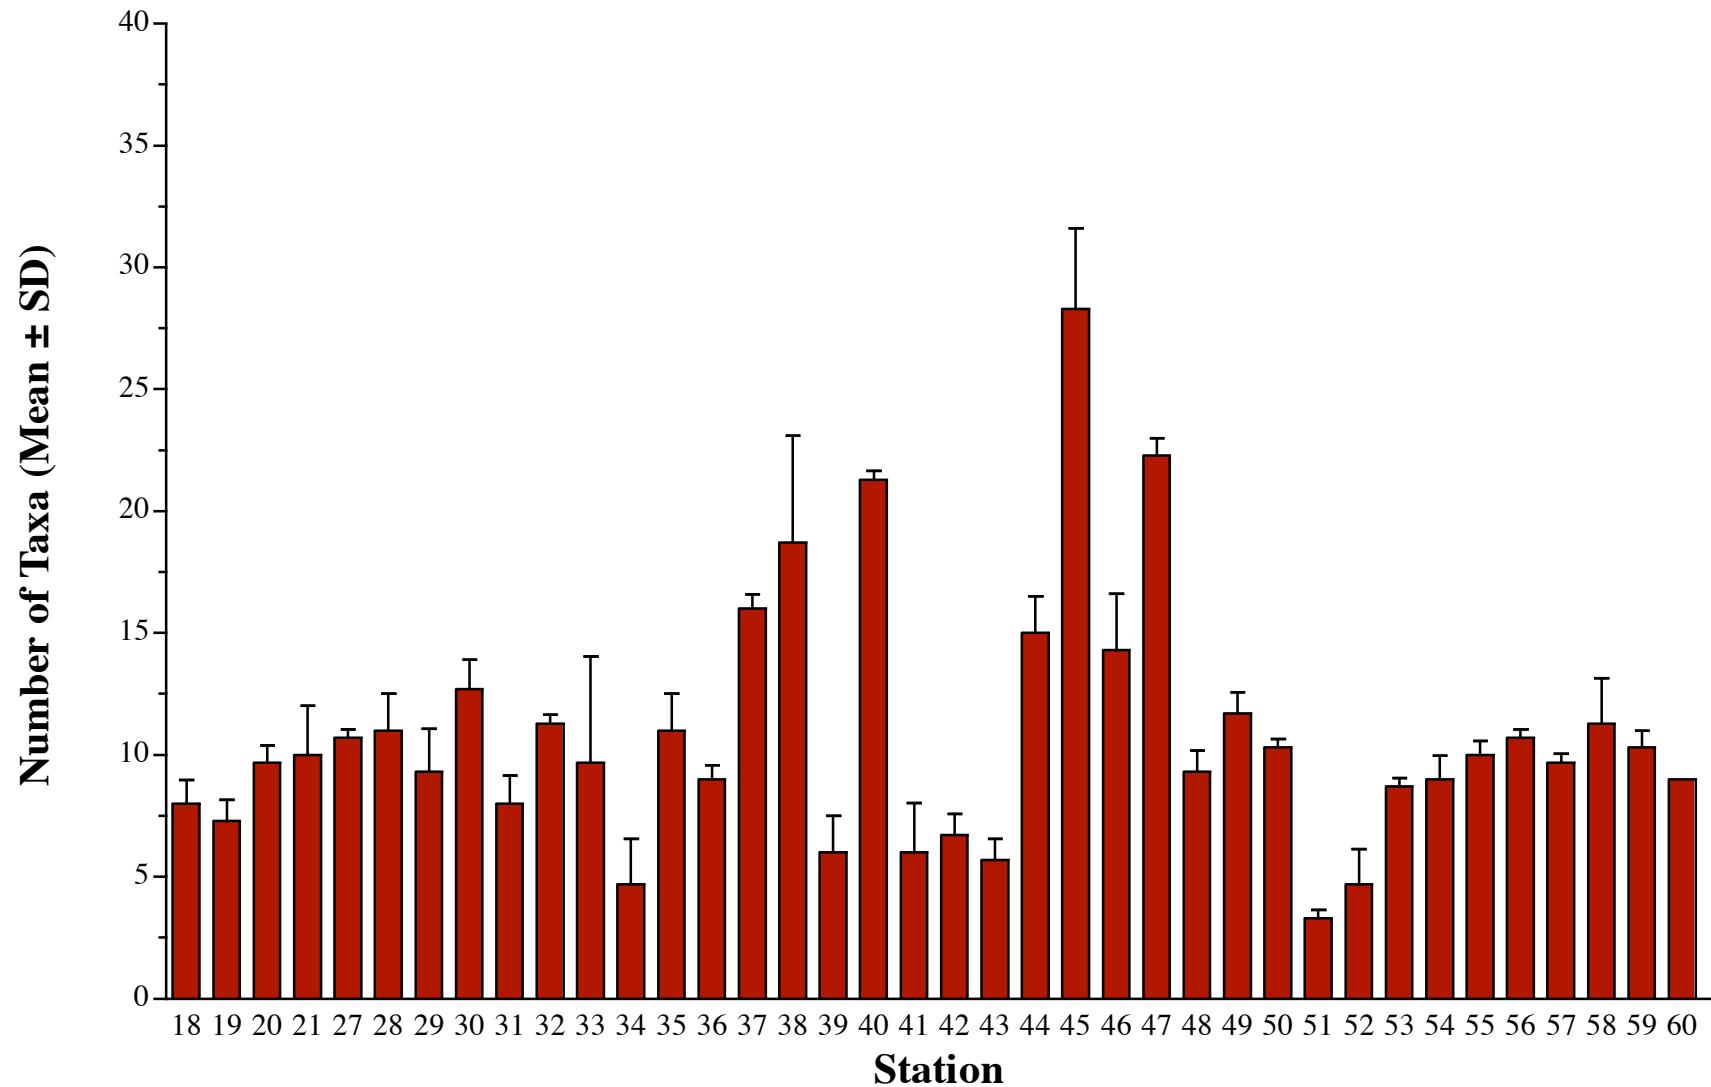

Figure 6. Taxa density data for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

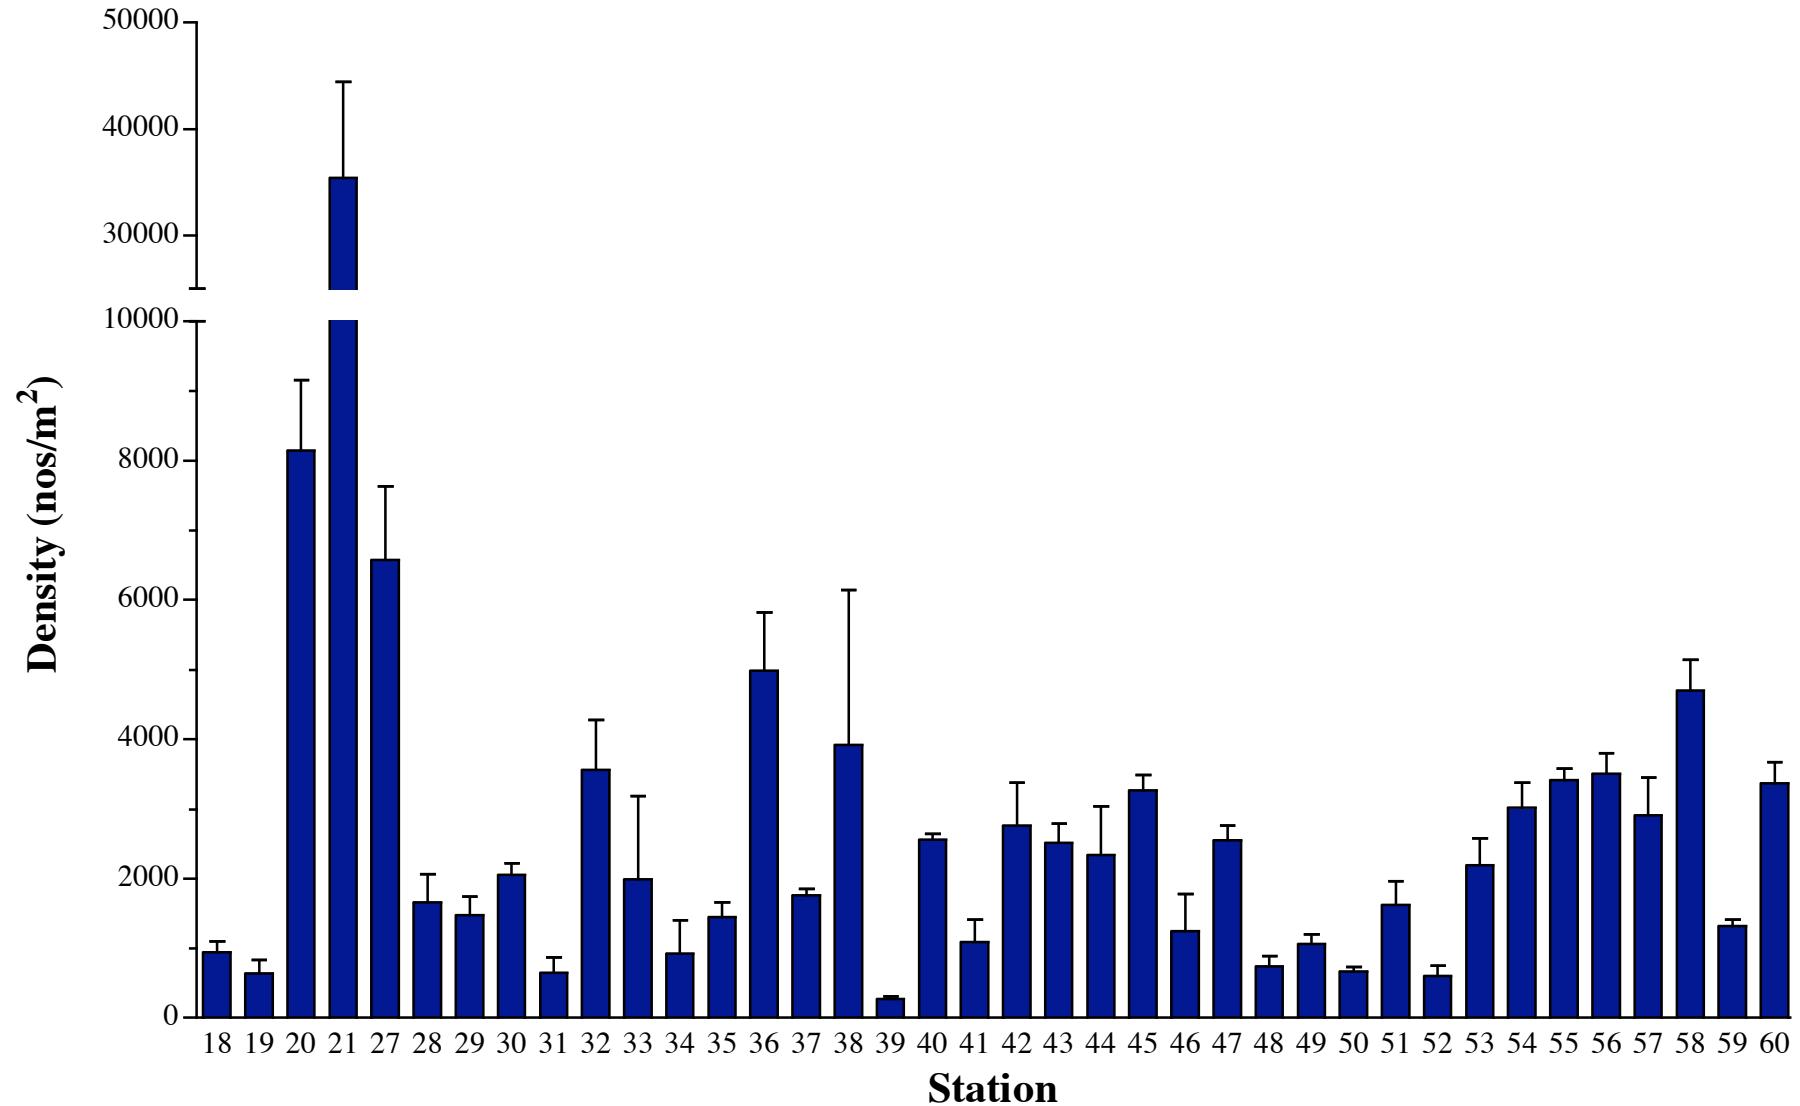

Figure 7. Taxa diversity (H') data for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

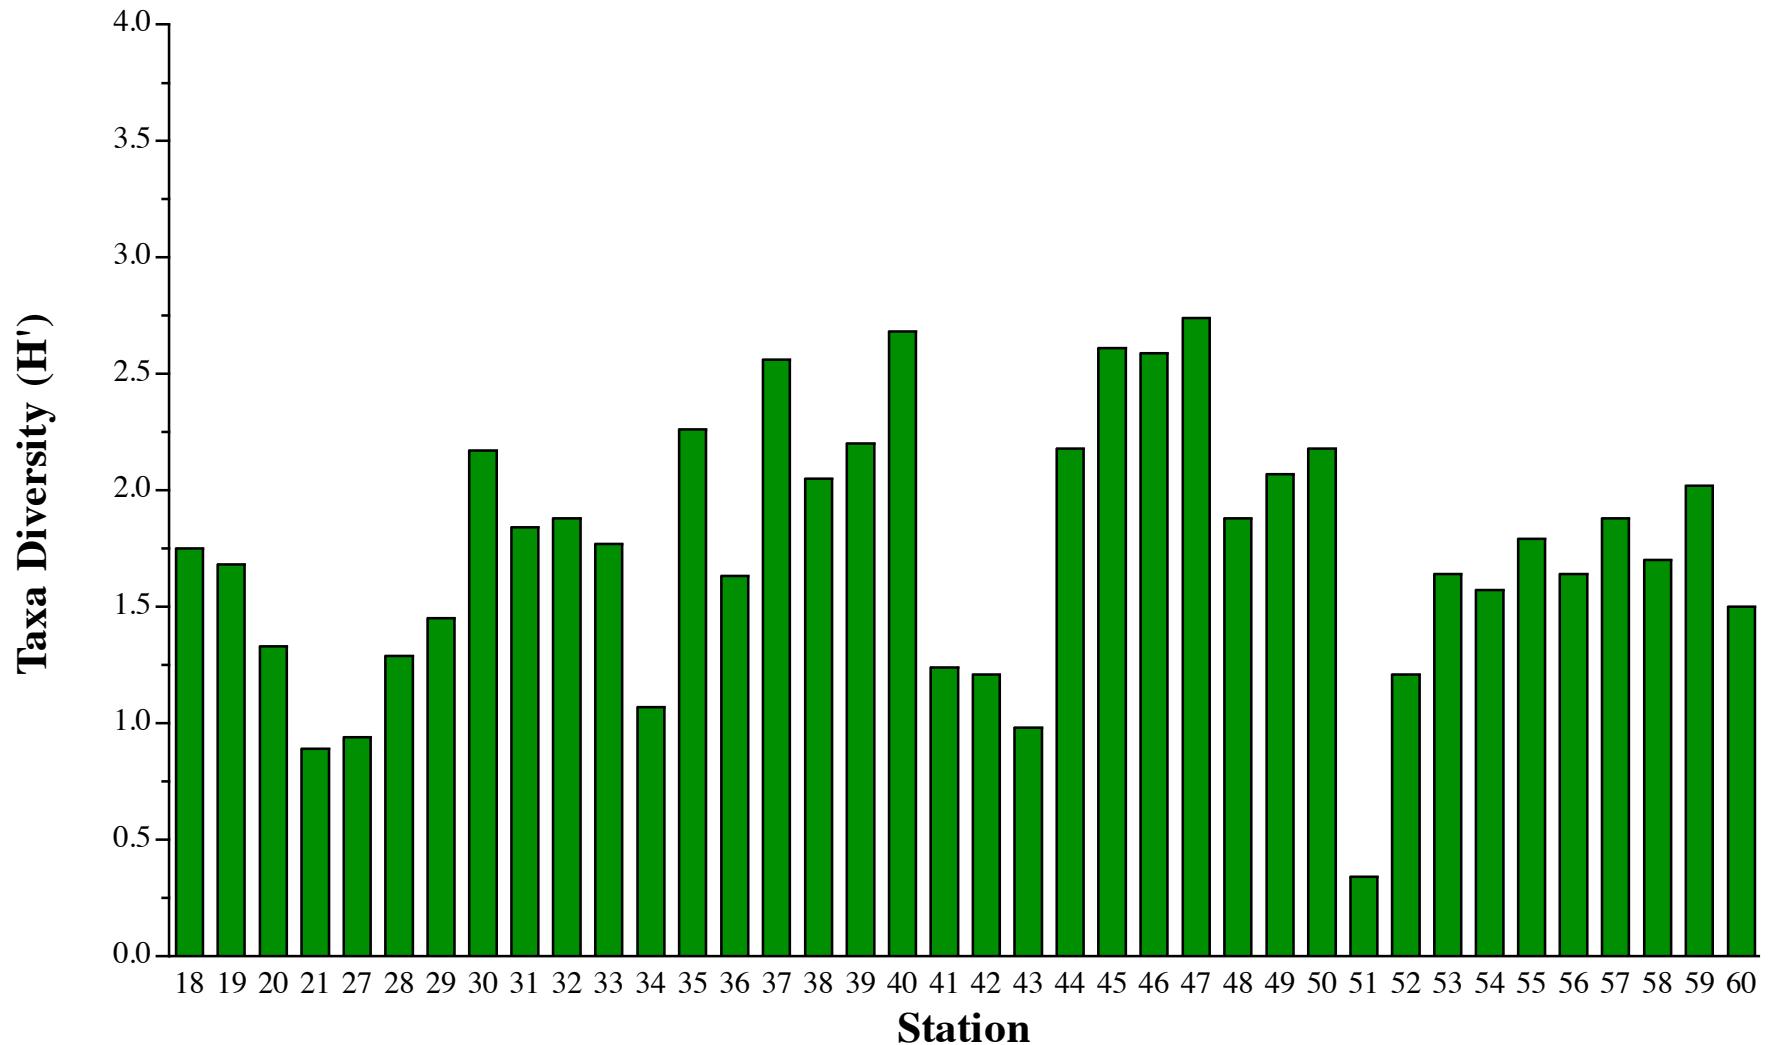

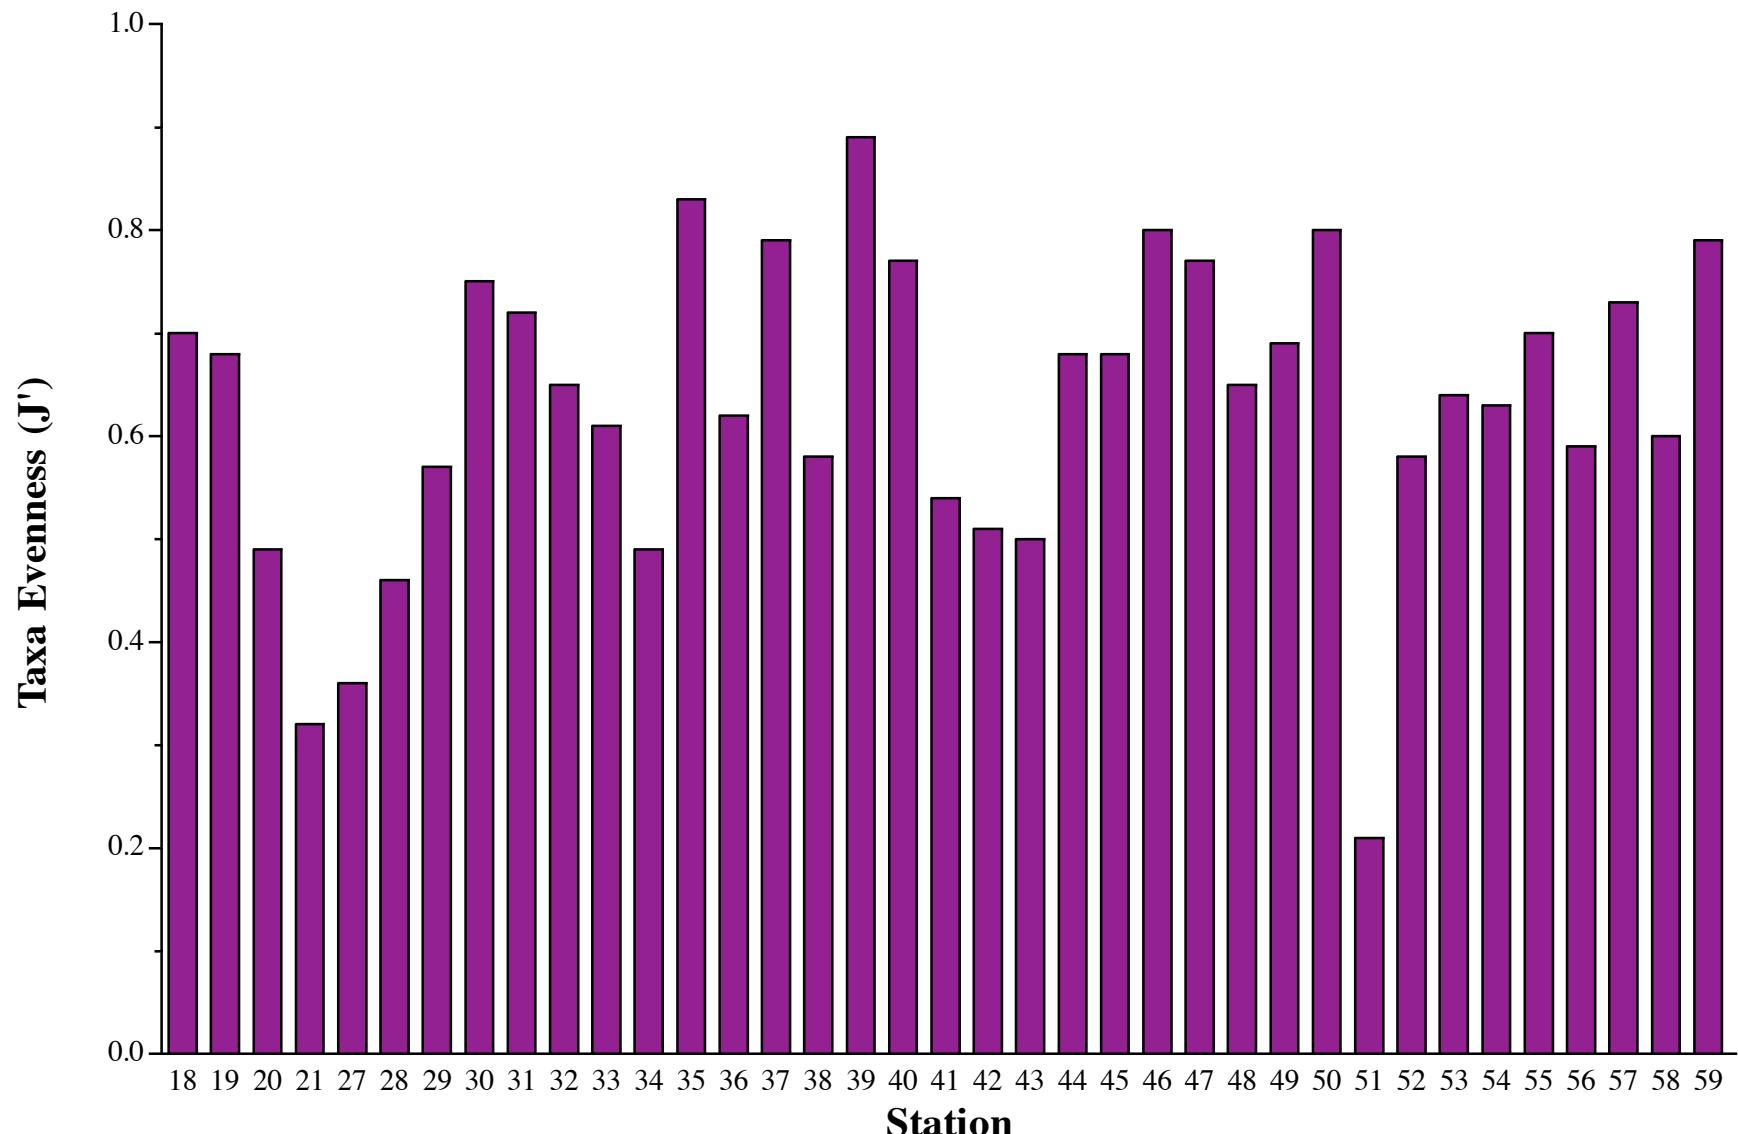

Figure 8. Taxa evenness (J') data for the Chesapeake Bay stations, 2004 (Stations 18-21, 27-60).

APPENDICES

QUALITY ASSURANCE STATEMENT

Client/Project: [NOAA](#)

Work Assignment Title: [Chesapeake Bay-2004](#)

Task Number: [003](#)

Description of Data Set or Deliverable: [114 Benthic macroinvertebrate samples collected in 2004; Young Dredge grabs.](#)

Description of audit and review activities: Judged accuracy rates were well above standard levels for sorting and taxonomy. Laboratory QC reports were completed.

Copies of QC results follow (see attachment.) All taxonomic data were entered into computer and printed. This list was checked for accuracy against original taxonomic data sheets.

Description of outstanding issues or deficiencies which may affect data quality: [None](#)
